Historical Equity Risk Premium

- The long-term (1926-2013) real equity risk premium was approximately 6.2%.
- This figure aligns with historical averages observed in prior decades but has experienced fluctuations influenced by macroeconomic factors.

Recent Period Analysis (1995-2014)

- The average premium during this period decreased to around 5.5%, reflecting:

- Elevated stock market valuations.
- Increased investor risk aversion.

Implications for Valuation and Portfolio Management

Comparison with Other Sources

- The Ibbotson premium of 6.2% aligns closely with other academic estimates, such as those from Dimson, Marsh, and Staunton, though differences exist based on methodologies.

- The consensus underscores the importance of context, economic regime, and measurement approach.

Broader Implications and Critiques

While the Ibbotson data remains influential, the 2014 report also invites critical examination of its methodologies and assumptions.

Limitations of Historical Data

- The reliance on historical averages may not fully capture future market conditions.

- Structural changes in markets, regulation, and global integration affect the applicability of past premiums.

Forward-Looking Challenges

- Estimating future premiums involves subjective judgment.
- The low-interest-rate environment complicates traditional models.

Market Timing and Behavioral Factors

- Investor sentiment and behavioral biases influence premiums.
- Periods of exuberance or pessimism can distort historical averages.

Policy and Economic Considerations

- Central bank policies and fiscal stimulus impact market expectations.
- Demographic shifts and technological advances shape investor risk appetite.
