Types of Ventilators

- **Positive Pressure Ventilators:** Deliver air under positive pressure to assist or replace spontaneous breathing.

- **Negative Pressure Ventilators:** Less common, mimic natural breathing by creating sub-atmospheric pressure around the chest.

Ventilation Modes

- **Assist-Control (A/C):** Provides full ventilatory support, delivering breaths at set rate and volume.

- **Synchronized Intermittent Mandatory Ventilation (SIMV):** Allows spontaneous breathing between mandatory ventilator breaths.

- **Pressure Support Ventilation (PSV):** Supports spontaneous breaths with preset pressure levels.

- **Continuous Positive Airway Pressure (CPAP):** Maintains positive pressure throughout spontaneous breathing, used in weaning.

Key Ventilator Settings and Parameters

- **tidal volume (VT):** The amount of air delivered with each breath.

- **Respiratory rate (RR):** Number of breaths per minute.

- **FiO2:** Fraction of inspired oxygen, adjustable based on oxygenation needs.

- **PEEP:** Positive end-expiratory pressure, prevents alveolar collapse and improves oxygenation.

3. Troubleshooting and Monitoring Ventilated Patients

Effective management involves continuous monitoring and prompt troubleshooting to address issues such as:

- Unusual breath sounds or alarms indicating disconnection or equipment malfunction.
- Changes in patient's oxygenation or ventilation status.
- Barotrauma or volutrauma from excessive pressures.
- Patient-ventilator asynchrony, requiring adjustment of settings or sedation.

Monitoring tools include pulse oximetry, capnography, and ventilator waveforms, all discussed in Chapter 19 to aid clinicians in providing safe care.
