Introduction to Head and Neck Oncology

Understanding Head and Neck Cancers

Head and neck cancers encompass a diverse group of malignant tumors originating in the mucosal surfaces of the oral cavity, pharynx, larynx, sinuses, nasal cavity, salivary glands, and other related structures. They account for approximately 4% of all cancers globally, with squamous cell carcinoma being the most common histological subtype.

Etiology and Risk Factors

Key risk factors include:

- tobacco use (smoking and smokeless tobacco)
- alcohol consumption
- human papillomavirus (HPV) infection, especially in oropharyngeal cancers
- environmental exposures to carcinogens
- genetic predispositions

Understanding these factors is vital for prevention, early detection, and tailoring treatment strategies.

- Modified radical neck dissection: preserves some non-lymphatic structures
- Selective neck dissection: targeted removal of lymph node groups

Reconstructive Surgery

Post-resection defects require reconstruction to restore function and aesthetics:

- Free flap reconstructions (e.g., radial forearm, fibula)
- Pedicled flaps (e.g., pectoralis major)
- Tissue engineering and regenerative techniques

Adjuvant and Non-Surgical Therapies

Radiation Therapy

Often combined with surgery for advanced cases or positive margins:
