Problem: Given a sample $\{x_1, x_2, \dots, x_n\}$ from a normal distribution with unknown mean μ and known variance σ^2 , find a 95% confidence interval for μ .

Solution:

- The sample mean $\bar{x}$ is an unbiased estimator of μ .
- Since the variance is known, the confidence interval is:

$$\bar{x} \pm z_{\alpha/2} \frac{\sigma}{\sqrt{n}}$$

- For 95% confidence, $z_{0.025} \approx 1.96$.

2. Hypothesis Testing for Population Proportion

Problem: Test whether the proportion p in a population equals 0.6 based on a sample of size 100 with 65 successes at a 5% significance level.

Solution:

- Null hypothesis: $H_0: p = 0.6$
- Alternative hypothesis: $H_1: p \neq 0.6$
- Test statistic:

$$z = \frac{\hat{p} - p_0}{\sqrt{\frac{p_0(1 - p_0)}{n}}}$$

where $\hat{p} = 65/100 = 0.65$.

- Compute:

$$z = \frac{0.65 - 0.6}{\sqrt{\frac{0.6 \times 0.4}{100}}} = \frac{0.05}{\sqrt{0.0024}} \approx 1.02$$

- Since $|z|$

Philosophy of mathematics and mathematical practice

Philosophy of mathematics and mathematical practice is a profound field that explores the foundational questions, conceptual underpinnings, and real-world applications of mathematics. It bridges abstract philosophical inquiry with the tangible methods mathematicians employ daily. Understanding this discipline not only deepens our appreciation of mathematical truths but also sheds light on how mathematics influences science, technology, and our understanding of the universe.

Introduction to the Philosophy of Mathematics

Mathematics has long been regarded as a cornerstone of scientific progress, yet its philosophical foundations remain a subject of debate. Philosophers of mathematics analyze questions such as: What is the nature of mathematical objects? Do numbers and shapes exist independently of human thought? How do we justify mathematical truths? These inquiries have led to several key perspectives.

Major Schools of Thought in the Philosophy of Mathematics

- **Logicism:** Proposes that mathematics reduces to logic, suggesting that all mathematical truths

can be derived from logical principles. Prominent proponents include Bertrand Russell and Alfred North Whitehead.

- **Formalism:** Emphasizes the formal systems and symbolic manipulations of mathematics, contending that mathematics is essentially a game played with symbols, with little regard to their intrinsic meaning.

- **Intuitionism:** Argues that mathematical objects are mental constructions and that mathematical truths are known through intuition. L.E.J. Brouwer was a leading figure in this school.

- **Structuralism:** Focuses on the structures that mathematical objects form rather than the objects themselves. It suggests that the identity of mathematical entities depends on their position within a structure.

- **Platonism:** Asserts that mathematical entities exist independently of human minds in an abstract realm, and mathematicians discover rather than invent these objects.

Core Questions in the Philosophy of Mathematics

What Are Mathematical Objects?

Understanding what constitutes a mathematical entity is central. Are numbers, sets, and functions real, abstract, or simply useful fictions? The debate influences how we interpret mathematical statements and their truth values.

How Do We Justify Mathematical Truths?

Mathematicians often rely on proof and deduction. Philosophers analyze whether these methods are sufficient or if other forms of justification are necessary, such as intuition or empirical evidence.

Is Mathematics Discoverable or Invented?

This question ties into the platonist versus nominalist debate. Are we uncovering pre-existing truths, or creating new mathematical concepts?
