This project not only tests theoretical knowledge but also emphasizes practical skills such as circuit assembly, troubleshooting, and performance evaluation.

Core Components of AC/DC Power Supply

Rectifiers

Rectification is the process of converting AC to DC. The two main types are:

- **Half-wave rectifier:** Uses a single diode to convert only one half-cycle of AC, resulting in a pulsating DC with high ripple.
- **Full-wave rectifier:** Uses four diodes (bridge rectifier) or a center-tapped transformer to convert both half-cycles, providing smoother DC.

For most ET1210 final projects, a full-wave bridge rectifier is preferred for efficiency.

Filters

Filtering reduces the ripple from the rectified output. Common filtering components include:

- **Capacitors:** Large electrolytic capacitors are used to smooth the pulsating DC.
- **Inductors:** Used in LC filters for additional ripple reduction.

The size of the filter capacitor directly impacts the smoothness and stability of the output voltage.

Voltage Regulation

To achieve a stable DC output, voltage regulators are employed:

- **Linear regulators:** Simple and provide low noise but are less efficient.
- **Switching regulators:** More efficient, suitable for higher power applications.

Common voltage regulator ICs include 7805 (for +5V output) and similar devices.
