## Sample Question Breakdown and Solutions

To illustrate the approach to answering Paper 4 questions, let's analyze a typical question and provide detailed solutions.

### Question 1: Titration to Find the Concentration of an Acid

Given:

A student titrates 25.0 cm<sup>3</sup> of sulfuric acid (H<sub>2</sub>SO<sub>4</sub>) with 0.100 mol/dm<sup>3</sup> sodium hydroxide (NaOH). The titration requires 30.0 cm<sup>3</sup> of NaOH to neutralize the acid.

Task:

Calculate the concentration of the sulfuric acid.

## Step-by-step Solution:

- **Write the balanced chemical equation:**

- **Determine moles of NaOH used:**

$$\text{Concentration (C)} = 0.100 \text{ mol/dm}^3 = 0.100 \text{ mol/1000 cm}^3$$

$$\text{Volume (V)} = 30.0 \text{ cm}^3$$

$$\text{Number of moles (n)} = C \times V / 1000 = 0.100 \times 30.0 / 1000 = 0.003 \text{ mol}$$

- **Relate moles of NaOH to moles of H<sub>2</sub>SO<sub>4</sub>:**

- From the balanced equation, 1 mol H<sub>2</sub>SO<sub>4</sub> reacts with 2 mol NaOH.

$$\text{Therefore, moles of H}_2\text{SO}_4 = \text{moles of NaOH} / 2 = 0.003 / 2 = 0.0015 \text{ mol}$$

- **Calculate concentration of H<sub>2</sub>SO<sub>4</sub>:**

$$\text{Concentration} = \text{moles} / \text{volume in dm}^3$$

$$\text{Volume of acid sample} = 25.0 \text{ cm}^3 = 25.0 / 1000 = 0.025 \text{ dm}^3$$

$$\text{Concentration} = 0.0015 \text{ mol} / 0.025 \text{ dm}^3 = 0.06 \text{ mol/dm}^3$$

## Final Answer:

The concentration of the sulfuric acid is 0.060 mol/dm<sup>3</sup>.

### Detailed Analysis of Key Questions (Sample Breakdown)

Let's analyze a typical question from the June 04 Paper 4 and its answer to illustrate the approach.

### Sample Question:

"In an experiment to prepare a sample of pure compound X, a student recrystallizes the impure sample. The mass of impure sample was 10.0 g, and after recrystallization, the pure crystals weighed 6.2 g. Calculate the percentage yield of pure compound X. Explain factors that could affect the yield."

### Sample Answer Breakdown:

- Calculation of Percentage Yield:

- Known data:
  - Impure sample mass = 10.0 g
  - Pure crystals obtained = 6.2 g

- Assumption: The theoretical maximum yield corresponds to the pure compound X present in the initial sample, assuming all impurities are removed.

- Calculation:
- Percentage yield =  $(\text{Actual yield} / \text{Theoretical yield}) \times 100$
- Here, actual yield = 6.2 g
- Theoretical yield is based on the initial amount, assuming complete conversion
- If the initial impure sample contains only the relevant compound, then:
- Percentage yield =  $(6.2 / 10.0) \times 100 = 62\%$
  
- Factors Affecting Yield:
  
- Incomplete recrystallization: Some compound may remain dissolved or lost during filtration.
- Impurities retained: Not all impurities are removed; some may be co-precipitated.
- Loss during transfer: Crystals can be lost during filtering, washing, or drying.
- Solubility issues: Excessive or insufficient solvent can affect crystal formation.
- Temperature control: Improper cooling or heating can lead to smaller or fewer crystals.
  
- Conclusion:

This question tests both calculation skills and understanding of practical chemistry procedures. Accurate measurement, careful handling, and understanding of recrystallization efficiency directly influence the yield.

### Tips for Success in Chemistry Paper 4

- Practice Past Papers: Familiarize yourself with question styles and time management.
- Master Data Interpretation: Be quick at analyzing experimental data and spotting trends.
- Revise Calculations: Ensure all formulas are memorized and understood.
- Understand Concepts: Be able to explain phenomena, not just memorize facts.
- Use Diagrams: When appropriate, draw diagrams to clarify explanations.
- Write Clearly: Use scientific language and organize answers logically.
