Sample UCE Chemistry Paper 2 Questions and Answers

Below are examples of common questions with detailed answers to guide students:

Question 1: Describe the structure of an atom and explain how electrons are arranged in an atom.

Answer:

An atom consists of a central nucleus containing positively charged protons and neutral neutrons, surrounded by negatively charged electrons. The electrons occupy regions called energy levels or shells around the nucleus. The arrangement of electrons in an atom follows specific rules:

- Electrons fill the lowest energy levels first (Aufbau principle).
- Each energy level can hold a maximum number of electrons: 2 in the first shell, 8 in the second, 8 in the third, and so on (following the octet rule).
- Electrons are arranged in shells as per the electron configuration, for example, oxygen has 8 electrons arranged as 2 in the first shell and 6 in the second.

This structure explains atomic stability and reactivity, as atoms tend to gain, lose, or share electrons to achieve a full outer shell.

Question 2: Explain the difference between ionic and covalent bonds with examples.

Answer:

Ionic Bonds:

- Formed when electrons are transferred from one atom to another.
- Typically occur between metals and non-metals.
- Result in the formation of positively charged ions (cations) and negatively charged ions (anions).
- Example: Sodium chloride (NaCl) forms when sodium donates an electron to chlorine, resulting in Na⁺ and Cl⁻ ions held together by electrostatic attraction.

Covalent Bonds:

- Formed when atoms share electrons to achieve full outer shells.
- Usually occur between non-metal atoms.
- Can be single, double, or triple bonds depending on the number of shared electron pairs.
- Example: Water (H₂O), where oxygen shares electrons with two hydrogen atoms.

The key difference lies in electron transfer versus sharing, influencing properties like melting point, solubility, and electrical conductivity.
