Sample Merriam Dynamics Kinematics Problems with Solutions

Problem 1: Velocity of a Point in a Slider-Crank Mechanism

Given a slider-crank mechanism where the crank AB rotates at 300 rpm, with length $AB = 0.15\,m$, and the connecting rod BC has length $0.5\,m$. Find the velocity of the slider C when the crank makes a 60° angle with the horizontal.

Solution:

- **Identify knowns:** $\omega_{AB} = 300\,rpm = \frac{300 \times 2\pi}{60} \approx 31.42\,rad/sec$; $\theta = 60^\circ$; $AB = 0.15\,m$; $BC = 0.5\,m$.
- **Convert rpm to rad/sec:** $\omega_{AB} = 31.42\,rad/sec$.
- **Determine the velocity of point B:** $\vec{v}_B = \vec{\omega}_{AB} \times \vec{r}_{AB}$.
-

Calculate $\vec{v}_B$:

$$
v_B = \omega_{AB} \times AB = 31.42\,rad/sec \times 0.15\,m \approx 4.71\,m/sec
$$

Direction: perpendicular to AB, following the right-hand rule.

- **Use relative velocity equation:** $v_C = v_B + v_{C/B}$, but since C is on the connecting rod BC, and assuming the mechanism is planar and rigid, apply the velocity polygon or complex vector method to find v_C.
-

Apply geometric approach:

- Construct the velocity triangle at point B, considering the known velocity magnitude and direction.
- Use the law of sines or cosines to resolve the components.

- **Result:** The slider C moves with a velocity approximately $4.71\,m/sec$ in the horizontal direction when the crank is at 60°.

Problem 2: Accelerations in a Four-Bar Linkage

In a four-bar linkage, the crank AB rotates at 150 rpm counterclockwise, with length $AB = 0.2\,m$. The coupler BC has length $0.5\,m$, and the fixed link AD is 0.4 m. Find the acceleration of the coupler point C when $\angle ABC = 45^\circ$.

Solution:

- **Convert rotational speed:** $\omega_{AB} = \frac{150 \times 2\pi}{60} = 15.7\,rad/sec$.
- **Determine the velocity of B:**

$$
v_B = \omega_{AB} \times AB = 15.7 \times 0.2 = 3.14\,m/sec
$$

- **Apply velocity analysis:**

- Use the velocity polygon to find the direction of v_B.
- Resolve to find velocity components of point C.
- Use geometric relations to find the velocity of C.

- **Calculate acceleration:**

- Determine the angular acceleration α_{AB} if necessary (assumed zero if steady speed).
- Use the acceleration equation:

$$
\vec{a}_C = \vec{\alpha}_{AB} \times \vec{r}_{AC} + \vec{\omega}_{AB} \times (\vec{\omega}_{AB} \times \vec{r}_{AC}) + \text{relative acceleration terms}
$$

- Since α_{AB} is not given, assume zero for simplicity, then:

$$
a_C = \omega_{AB}^2 \times r_{AC}
$$

- **Final result:**

$$
a_C = (15.7)^2 \times 0.5 \approx 123.45\,m/sec^2
$$

Understanding Merriam Dynamics in Kinematics

What Is Merriam's Approach?

Merriam's method refers to a structured approach to solving dynamics and kinematics problems, emphasizing clarity, systematic analysis, and logical reasoning. It often involves:

- Clearly defining the problem parameters
- Drawing accurate free-body or displacement diagrams
- Applying fundamental kinematic equations
- Using vector analysis for complex motions
- Validating solutions through units and physical plausibility

This approach is especially beneficial in educational settings, where students grapple with abstract concepts and complex diagrams. Merriam's problems typically incorporate real-world mechanisms?like linkages, gears, or slider-crank mechanisms?that challenge students to apply multiple concepts simultaneously.

Core Concepts in Merriam Kinematics Problems

- Types of Motion

Merriam problems often involve various types of motion, including:

- Translational motion: Movement along a straight line
- Rotational motion: Movement about an axis
- Combined motion: A combination of translation and rotation, such as in linkages or gears

- Kinematic Equations

Fundamental equations used include:

- $v = v_0 + a t$ (velocity-time relation)

- $s = s_0 + v_0 t + \frac{1}{2} a t^2$ (displacement-time relation)
- For rotational motion: $\omega = \omega_0 + \alpha t$, $\theta = \theta_0 + \omega_0 t + \frac{1}{2} \alpha t^2$

- Relative Velocity and Acceleration

Understanding how different parts of a mechanism move relative to each other is critical. The key principles include:

- Velocity of a point on a rotating body: $v = r \omega$
- Relative velocity equations: $v_{AB} = v_A + v_{B/A}$

- Instantaneous Centers of Rotation

Merriam problems often incorporate the concept of instantaneous centers, simplifying complex planar motions by treating them as pure rotation about a specific point at a given instant.

Typical Merriam Kinematics Problems with Solutions

Problem 1: Slider-Crank Mechanism ? Calculating the Velocity of the Slider

Problem Statement:

A slider-crank mechanism consists of a crank rotating at 300 rpm with a length of 0.2 m. The connecting rod length is 0.5 m. Determine the velocity of the slider when the crank makes a 60° angle with the horizontal.

Solution Approach:

- Identify Known Data:

- $\omega_{crank} = 300 \, \text{rpm} = \frac{300 \times 2\pi}{60} = 10\pi \, \text{rad/sec}$
- Crank length $r = 0.2\, \text{m}$
- Connecting rod length $L = 0.5\, \text{m}$
- Crank angle $\theta = 60^\circ$

- Convert ω to rad/sec:

$\omega = 10\pi \approx 31.416 \, \text{rad/sec}$

- Determine the velocity of the crank's end:

$v_{crank} = r \omega \sin \theta$

$v_{crank} = 0.2 \times 31.416 \times \sin 60^\circ$

$v_{crank} = 0.2 \times 31.416 \times 0.866 \approx 5.44\, \text{m/sec}$

- Apply the velocity relation for the slider:

Using the loop-closure equation and relative motion analysis, the slider velocity v_s can be calculated via the velocity triangle or using the velocity method:

$$
v_s = v_{crank} \cos \theta + \text{additional components}
$$

But more straightforwardly, the velocity of the slider (assuming a proper configuration) is:

$$
v_s = r \omega \cos \theta
$$

$v_s = 0.2 \times 31.416 \times \cos 60^\circ = 0.2 \times 31.416 \times 0.5 \approx 3.14\, \text{m/sec}$

Final Answer:

The velocity of the slider at the given instant is approximately 3.14 m/sec.

Problem 2: Determining Angular Acceleration in a Linkage

Problem Statement:

A four-bar linkage operates with a fixed link of 0.4 m rotating at 120 rpm. The coupler link of length 0.3 m makes a 45° angle at a certain instant. Find the angular acceleration of the coupler if the crank's angular acceleration is 50 rad/sec^2.

Solution Approach:

- Convert known data:

  - $\omega_{fixed} = 120 \, \text{rpm} = 4\pi \, \text{rad/sec}$
  - $\alpha_{crank} = 50\, \text{rad/sec}^2$
  - Link lengths: $r = 0.4\, \text{m}$, $l = 0.3\, \text{m}$
  - Angle $\theta = 45^\circ$

- Apply the velocity and acceleration loop equations:

The linkage's velocity analysis yields the angular velocity of the coupler. Subsequently, the acceleration analysis involves differentiating the velocity equations to find angular acceleration.

- Velocity analysis:

Use the loop equation:

$$
r \omega_{crank} + l \omega_{coupler} = \text{constant}
$$

Solve for $\omega_{coupler}$.

- Acceleration analysis:

Using the acceleration loop:

$$
r \alpha_{crank} + l \alpha_{coupler} = - r \omega_{crank}^2 \sin \theta - l \omega_{coupler}^2 \sin \phi
$$

Where ϕ is the angle of the coupler link.

- Calculate $\alpha_{coupler}$:

Substitute known values and solve for the angular acceleration.

Final Result:

This calculation involves detailed vector analysis, but after solving, the angular acceleration of the coupler is approximately X rad/sec^2 (exact value depends on the precise angles and solving the equations).

Advanced Topics in Merriam Kinematics Problems

Instantaneous Center of Rotation (ICR)

A powerful concept in Merriam problems is the ICR, which simplifies complex planar motions. For a point in a mechanism:

- The ICR is the point about which the body appears to rotate instantaneously.
- To find the ICR, draw velocity vectors and locate their intersection.

Application:

In a four-bar linkage, the ICRs can be found for each link at a given instant, simplifying velocity and acceleration calculations.

Understanding how different parts of a mechanism relate is crucial:

- Relative velocity: $\vec{v}_{B/C} = \vec{v}_B - \vec{v}_C$
- Relative acceleration: $\vec{a}_{B/C} = \vec{a}_B - \vec{a}_C$

These concepts help analyze complex linkages and slider mechanisms.

Practical Considerations

- Precise diagramming is essential.
- Units must be consistent.
- Physical plausibility checks prevent calculation errors.

Tips for Solving Merriam Kinematics Problems Effectively
