Detailed Breakdown of the 2014 Exam Questions and Model Responses

Below, we analyze some of the typical questions from the June 2014 F324 exam, based on the unofficial markscheme, with explanations of what examiners are seeking.

Question 1: Data Representation

Example Question:

Explain how an 8-bit binary number can be used to represent decimal numbers from 0 to 255.

Expected Points in Markscheme:

- 8 bits means 2^8 possible combinations
- Range from 0 to 255 (decimal)
- Each binary number corresponds directly to a decimal value
- Use of the term 'unsigned binary number'

Sample Student Answer (High-Scoring):

"An 8-bit binary number uses 8 bits, each of which can be 0 or 1. Since $2^8 = 256$, the possible values range from 0 (00000000) to 255 (11111111). This allows the binary number to directly represent decimal numbers from 0 to 255 without the need for sign bits."

Marking Points:

- Mention of 8 bits and their capacity ($2^8 = 256$)
- Correct range (0-255)
- Explanation of direct correspondence between binary and decimal
- Use of correct terminology ("unsigned binary number")

Question 2: Programming Constructs**Example Question:**

Write a pseudocode snippet that uses a loop to print numbers from 1 to 10.

Expected Points in Markscheme:

- Initialization of loop counter
- Loop condition (less than or equal to 10)
- Increment of counter
- Output statement inside the loop

Sample Student Answer:

```

SET counter TO 1

WHILE counter

PRINT counter

SET counter TO counter + 1

END WHILE

...

Marking Points:

- Correct initialization (`SET counter TO 1`)
- Correct loop condition (`counter
- Correct incrementation (`counter + 1`)
- Correct output statement (`PRINT counter`)
- Proper use of pseudocode syntax

### Question 3: Algorithms

Example Question:

Describe a simple algorithm to search for a specific number in an ordered list.

Expected Points in Markscheme:

- Use of a sequential or binary search
- Explanation that the list is ordered
- Checking each element (sequential search) or dividing the list (binary search)
- Returning the position or indicating if the number isn't found

Sample Student Answer:

"A binary search algorithm can be used by comparing the target number to the middle element of the list. If they are equal, the search ends. If the target is smaller, the search continues in the lower half; if larger, in the upper half. This process repeats until the number is found or the list is exhausted."

Marking Points:

- Recognition of the list being ordered
- Explanation of the binary search process
- Mention of dividing the list
- Return position or indication of absence

## Understanding the Context of F324 and the June 2014 Examination

### What is F324?

F324 is a module code typically associated with specific units within A-level physics courses, especially under certain examination boards such as Edexcel or OCR. These modules often focus on fundamental concepts in physics, including mechanics, electricity, and thermal physics,

depending on the syllabus structure for that year.

In June 2014, the F324 examination was scheduled as part of the broader assessment framework for physics students aiming to demonstrate their understanding of core principles. The exam's design aimed to evaluate students' problem-solving skills, theoretical knowledge, and application abilities in various physics contexts.

## **The Significance of the June 2014 Exam**

The June 2014 sitting marked a critical point for many students preparing for university entry or progressing within their academic pathways. The exam was characterized by a mix of straightforward and challenging questions designed to differentiate levels of student understanding. The unofficial mark scheme emerged as a crucial tool for students and teachers to analyze performance, especially in the absence of an official version at that time.

## **What is an Unofficial Mark Scheme?**

### **Definition and Purpose**

An unofficial mark scheme is a collaboratively or independently compiled document that attempts to replicate or approximate the official grading criteria used by examiners. Unlike official mark schemes, which are released by examination boards post-assessment, unofficial versions are often created by educators, students, or exam analysts based on memory, question papers, or available information.

The primary purpose of an unofficial mark scheme is to:

- Provide insights into how examiners might have awarded marks.
- Help students understand what was expected in their responses.
- Assist teachers in preparing students for similar questions or future exams.
- Enable post-exam analysis of question difficulty and grading trends.

### **Limitations and Reliability**

While valuable, unofficial mark schemes are inherently speculative and may lack the precision of official documents. They can sometimes overestimate or underestimate grading criteria, leading to potential misinterpretations. Nonetheless, when cross-referenced with actual student performance data and question analyses, they remain useful tools.

#### Question 1: Polynomial Roots and Factorization

Given that  $x^4 + ax^3 + bx^2 + cx + d = 0$  has roots  $(2, -1, i, -i)$ , find the values of  $(a, b, c, d)$ .

This question demands understanding of polynomial roots and their relationship to coefficients via Viète's formulas.

#### Approach:

- Recognize the roots include complex conjugates  $i$  and  $-i$ , indicating factors of  $(x - i)(x + i) = x^2 + 1$ .
- The real roots  $2$  and  $-1$  correspond to factors  $(x - 2)$  and  $(x + 1)$ .
- The polynomial is thus factorized as:

$$\backslash$$

$$(x - 2)(x + 1)(x^2 + 1)$$

$$\backslash$$

- Expand step by step to find the coefficients.

Key Skills:

- Polynomial expansion
- Viète's relations
- Recognizing conjugate roots

## Question 2: Differentiation and Stationary Points

Find the coordinates of the stationary points of  $f(x) = x^3 - 6x^2 + 9x + 4$ , and determine their nature.

This problem tests differentiation skills and understanding of critical points.

Approach:

- Differentiate:  $f'(x) = 3x^2 - 12x + 9$ .
- Set  $f'(x) = 0$  to find critical points:

$$\backslash$$

$$3x^2 - 12x + 9 = 0 \rightarrow x^2 - 4x + 3 = 0$$

$$\backslash$$

$$\backslash$$

$$x = 1, 3$$

$$\backslash$$

- Find  $f(1)$  and  $f(3)$  for the y-coordinates.
- Use  $f''(x)$  to determine concavity:

[

$$f''(x) = 6x - 12$$

]

### Question 3: Complex Numbers and Roots

Solve  $z^4 = 16$ , where  $z$  is a complex number, and express the roots in polar form.

This involves understanding roots of complex equations via De Moivre's theorem.

Approach:

- Express 16 as  $16e^{i0}$ .
- The four roots are given by:

[

$$z_k = \sqrt[4]{16} \left( \cos \frac{\theta + 2k\pi}{4} + i \sin \frac{\theta + 2k\pi}{4} \right)$$

]

where  $\theta = 0$ , and  $k=0,1,2,3$ .

- Since  $\sqrt[4]{16} = 2$ , roots are at angles  $(0, \pi/2, \pi, 3\pi/2)$ .

- Roots:

[

$$z_0 = 2(\cos 0 + i \sin 0) = 2$$

]

[

$$z_1 = 2(\cos \frac{\pi}{2} + i \sin \frac{\pi}{2}) = 2i$$

]

[

$$z_2 = 2(\cos \pi + i \sin \pi) = -2$$

]

[
