Understanding Photosynthesis and Cellular Respiration

Basics of Photosynthesis

Photosynthesis is the process by which green plants, algae, and certain bacteria convert light energy into chemical energy stored in glucose. The overall reaction can be summarized as:

This process primarily occurs in the chloroplasts of plant cells, involving two main stages: the light-dependent reactions and the light-independent reactions (Calvin Cycle).

Basics of Cellular Respiration

Cellular respiration is the process by which cells break down glucose to produce energy in the form of ATP (adenosine triphosphate). It occurs in the mitochondria and can be summarized as:

This process has three main stages: glycolysis, the Krebs cycle, and the electron transport chain. Together, these processes enable organisms to harness energy from food sources efficiently.

Yo, it's photosynthesis, in the chloroplasts' glow,

Plants take in CO₂ and water, yo,

Sunlight hits chlorophyll, energy flows,

Making glucose and oxygen, that's how it goes!

Then cellular respiration kicks in, it's the flip,

Glucose gets broken, ATP's the trip,

Mitochondria work, oxygen's the grip,

Energy released, life's ultimate equip!
