The design and operation of these systems depend heavily on hydrogeological assessments, water demand forecasting, and environmental considerations.

Sources of Water Supply

Viessman emphasizes the importance of selecting sustainable and reliable sources, considering factors like water availability, quality, and environmental impact. Main sources include:

- Surface Water: Rivers, lakes, and reservoirs are primary sources, but vulnerable to seasonal variations and pollution.
- Groundwater: Wells tapping into aquifers provide a dependable alternative but require careful management to prevent overextraction.
- Rainwater Harvesting: An increasingly popular decentralized approach, especially in arid regions.
- Desalination: For coastal areas, seawater desalination offers an alternative, though it involves high energy consumption.

Water Treatment Processes

The treatment sequence is critical for ensuring safe drinking water. Viessman describes these processes extensively:

- Coagulation and Flocculation: Removal of suspended particles using chemicals like alum.
- Sedimentation: Allowing flocculated particles to settle out.
