Fundamental Circle Vocabulary

Understanding the basic vocabulary related to circles forms the foundation for more advanced topics. Here are some of the most important terms to know:

Circle

A circle is a set of all points in a plane that are equidistant from a fixed point called the center. The distance from the center to any point on the circle is called the radius.

Center

The fixed point inside the circle from which all points on the circle are equally distant. The center is often labeled as O.

Radius

A line segment connecting the center of the circle to any point on the circle. All radii in a circle are equal in length.

Diameter

A line segment passing through the center and connecting two points on the circle. It is twice as long as the radius: $D = 2r$.

Chord

A line segment with both endpoints on the circle. A diameter is a special type of chord.

Arc

A portion of the circumference of a circle. Arcs are named by their endpoints, for example, AB.

Sector

A region bounded by two radii and an arc, resembling a "slice" of the circle.

The distance around the circle. It can be calculated using the formula: $C = 2\pi r$ or $C = \pi d$.

Key Properties and Relationships

Understanding the properties and relationships between the various parts of a circle allows for problem-solving and geometric proofs.

Central and Inscribed Angles

- Central Angle: An angle whose vertex is at the center of the circle and whose sides intersect the circle. The measure of a central angle is equal to the measure of its intercepted arc.
- Inscribed Angle: An angle whose vertex is on the circle and whose sides intersect the circle. The measure of an inscribed angle is half the measure of its intercepted arc.

Arc Measures

- The measure of an arc is proportional to the central angle that intercepts it.
- For a full circle, the sum of the measures of all arcs equals 360° .

Relationship Between Chords, Secants, and Tangents

- Chord: A segment with both endpoints on the circle.
- Secant: A line that intersects the circle at two points.
- Tangent: A line that touches the circle at exactly one point, called the point of tangency.

Special Lines in Circles

Certain lines have specific properties that are vital in circle geometry.

Tangent Line

A line that touches the circle at exactly one point. The tangent is perpendicular to the radius drawn to the point of tangency.

Secant Line

A line that intersects the circle at two points, creating intersecting chords or segments.

Chord and Diameter Relationships

- The diameter bisects chords that are perpendicular to it.
- The longest chord in a circle is the diameter.

Important Theorems and Formulas

Familiarity with key theorems helps in solving complex problems involving circles.

Thales' Theorem

If A, B, and C are points on a circle where AC is a diameter, then the angle ABC is a right angle.

Chord Distance Formula

The perpendicular distance from the center to a chord can be found using:

$$d = \sqrt{r^2 - \left(\frac{c}{2}\right)^2}$$

where d is the distance from the center, r is the radius, and c is the length of the chord.

Area of a Sector

The area of a sector with central angle θ (in degrees) is:

$$\text{Area} = \frac{\theta}{360^\circ} \times \pi r^2$$
