Question/Answer What are the key components evaluated during an ARDMS vascular exam? The key components include assessing blood flow velocity, vessel patency, wall characteristics, presence of stenosis or occlusion, and detecting any abnormal collateral vessels or aneurysms. How is spectral Doppler used in vascular exams? Spectral Doppler measures blood flow velocities within vessels, helping to identify abnormal flow patterns, quantify stenosis severity, and evaluate hemodynamics in arteries and veins. What are common artifacts encountered during vascular ultrasound, and how can they be minimized? Common artifacts include mirror image, reverberation, and edge shadowing. They can be minimized by adjusting probe angulation, using appropriate gain settings, and optimizing Doppler angle to below 60 degrees. What criteria are used to diagnose a deep vein thrombosis (DVT) on ultrasound? Diagnosis of DVT is based on visualization of lack of compressibility of the vein, abnormal Doppler flow patterns, and echogenic thrombus within the vessel lumen. How do you differentiate between arterial and venous flow in a vascular exam? Arterial flow is typically pulsatile with higher velocities and spectral waveforms, while venous flow is non-pulsatile or phasic with lower velocities and may demonstrate spontaneous or augmented flow during maneuvers. What is the significance of a 'reverberation artifact' in vascular ultrasound? Reverberation artifact appears as multiple echo lines and can obscure or mimic pathology; recognizing it helps prevent misinterpretation of vessel lumen or surrounding tissues. What are the primary indications for a carotid duplex ultrasound exam? Indications include screening for carotid artery stenosis, evaluating cerebrovascular symptoms, monitoring known stenosis, or assessing post-intervention patency. How does patient positioning affect vascular ultrasound imaging? Proper positioning ensures optimal access to vessels, reduces patient discomfort, improves image quality, and allows better visualization of flow dynamics during the exam.
