ideal gas law answers pg 24

Understanding the ideal gas law and its related problems is essential for students studying chemistry and physics. The questions and answers found on page 24 often serve as a key resource for mastering concepts related to the behavior of gases under various conditions. This comprehensive guide aims to elucidate the typical problems presented in that section, provide detailed solutions, and enhance your grasp of the ideal gas law principles. Whether you're preparing for exams or seeking clarification on gas law concepts, this article offers an in-depth overview designed to improve your understanding and problem-solving skills.

Introduction to the Ideal Gas Law

Before diving into specific answers from page 24, it's important to revisit the fundamentals of the ideal gas law.

What is the Ideal Gas Law?

The ideal gas law describes the relationship among pressure (P), volume (V), amount of gas (n), and temperature (T) in an idealized gas. It is expressed as:

$$PV = nRT$$

where:

- P = pressure (atm, Pa, or kPa)
- V = volume (L, m³)
- n = number of moles (mol)
- R = ideal gas constant (8.314 J/mol·K or 0.0821 L·atm/mol·K)
- T = temperature (Kelvin)

This law combines Boyle's, Charles's, and Avogadro's laws into a single equation, providing a comprehensive description of gas behavior under ideal conditions.

Common Types of Problems in "pg 24" and Their Solutions

The problems on page 24 typically cover various scenarios involving the ideal gas law, such as

calculating unknown variables, converting units, and applying combined gas law concepts. Below are common problem types and detailed solutions.

- Calculating Pressure, Volume, or Temperature

Example Problem:

A 2.5 mol sample of an ideal gas occupies 10 liters at a temperature of 300 K. What is the pressure of the gas?

Solution:

Using the ideal gas law:

$$P = \frac{nRT}{V}$$

Plugging in the known values:

$$P = \frac{(2.5 \text{ mol}) \times (8.314 \text{ J/mol}\cdot\text{K}) \times (300 \text{ K})}{10 \text{ L}}$$

Note: To keep units consistent, convert volume to cubic meters or pressure to Pascals. Using R in J/mol·K and volume in m³:

$$1 \text{ L} = 1 \times 10^{-3} \text{ m}^3$$

So,

$$V = 10 \text{ L} = 10 \times 10^{-3} = 0.01 \text{ m}^3$$

Now,

$$P = \frac{2.5 \times 8.314 \times 300}{0.01}$$

$$P = \frac{2.5 \times 2494.2}{0.01}$$

$$P = \frac{6235.5}{0.01}$$

$$P = 623,550 \text{ Pa}$$

which is approximately 624 kPa.

- Using the Combined Gas Law

Example Problem:

A gas sample at 25°C and 1 atm occupies 5 liters. If the temperature increases to 50°C and pressure remains constant, what is the new volume?

Solution:

The combined gas law:

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2}$$

Since pressure is constant:

$$V_2 = V_1 \times \frac{T_2}{T_1}$$

Convert temperatures to Kelvin:

$$T_1 = 25 + 273 = 298 \text{ K}$$

$$T_2 = 50 + 273 = 323 \text{ K}$$

Calculate:

$$V_2 = 5 \text{ L} \times \frac{323}{298} \approx 5 \times 1.084 = 5.42 \text{ L}$$

Answer: The new volume is approximately 5.42 liters.

- Moles of Gas from Given Conditions

Example Problem:

What is the number of moles in a 22.4 L gas container at STP (Standard Temperature and Pressure)?

Solution:

At STP, 1 mol of gas occupies 22.4 liters. Therefore:

$$n = \frac{V}{22.4 \text{ L}}$$

$$n = \frac{22.4 \text{ L}}{22.4 \text{ L/mol}} = 1 \text{ mol}$$

Answer: There is 1 mole of gas.

Applying the Ideal Gas Law to Real-World Scenarios

The problems in pg 24 often involve real-world applications, such as calculating the behavior of gases in chemical reactions or industrial processes.

Gas Stoichiometry Problems

Example:

Determine the volume of hydrogen gas needed to react completely with 16 grams of oxygen in a combustion reaction:

Solution:

- Calculate moles of oxygen:

$$\text{Moles of } \text{O}_2 = \frac{16 \text{ g}}{32 \text{ g/mol}} = 0.5 \text{ mol}$$

- From the balanced equation, 1 mol of O_2 reacts with 2 mol of H_2 :

$$\text{Moles of } \text{H}_2 = 2 \times 0.5 = 1 \text{ mol}$$

- Use ideal gas law at STP to find volume:

$$V = n \times 22.4 \text{ L} = 1 \times 22.4 \text{ L} = 22.4 \text{ L}$$

Answer: Approximately 22.4 liters of hydrogen gas are needed.

Tips for Solving Ideal Gas Law Problems

- Always ensure units are consistent before plugging into the formula.
- Convert temperatures to Kelvin.
- Use the appropriate value of the gas constant R based on units.
- Pay attention to whether conditions are at constant pressure, volume, or temperature, and choose the correct formula or combined law accordingly.

Common Mistakes to Avoid

- Mixing units (e.g., using atm with liters and J with m^3).
- Forgetting to convert temperatures to Kelvin.
- Assuming gases behave ideally under non-ideal conditions (high pressure or low temperature).
- Using incorrect values of R for different units.
- Overlooking the need to convert grams to moles when dealing with mass.

Question What is the ideal gas law and how is it expressed mathematically? The ideal gas law describes the relationship between pressure, volume, temperature, and amount of gas, expressed as $PV = nRT$, where P is pressure, V is volume, n is moles, R is the gas constant, and T is temperature in Kelvin. How can I use the ideal gas law to find the volume of a gas at a different temperature? You can rearrange the ideal gas law to $V_1/T_1 = V_2/T_2$ (assuming constant pressure and moles) to find the new volume V_2 when the temperature T_2 changes, given initial volume V_1 and temperature T_1 . What assumptions are made when applying the ideal gas law? The ideal gas law assumes gases are composed of point particles with no intermolecular forces and that collisions are perfectly elastic, which is an approximation valid at high temperature and low pressure. How does changing pressure affect the volume of a gas according to the ideal gas law? At constant temperature and moles, increasing pressure decreases volume, following Boyle's law ($PV = \text{constant}$), which is a special case of the ideal gas law. What is the significance of the gas constant R in the ideal gas law? The gas constant R links pressure, volume, and temperature in the law; its value depends on the units used (e.g., $8.314 \text{ J/mol}\cdot\text{K}$ in SI units) and ensures the equation's consistency. How can the ideal gas law help in calculating the number of moles of a gas if the other variables are known? Rearranged as $n = PV / RT$, the ideal gas law allows you to calculate moles by dividing the product of pressure and volume by the product of the gas constant and temperature. Why is it important to convert temperature to Kelvin when using the ideal gas law? Temperature must be in Kelvin because the ideal gas law relies on absolute temperature; using Celsius or Fahrenheit would lead to incorrect results since the law's derivation assumes temperatures are in Kelvin.
